SELECT

**SELECT Syntax:**

[SELECT](#) is used to retrieve rows selected from one or more tables, and can include [JOIN](#) statements and subqueries. See [joins](#), and [subqueries](#). A [SELECT](#) statement can start with a [WITH](#) clause to define common table expressions accessible within the [SELECT](#). See [with](#).

The most commonly used clauses of [SELECT](#) statements are these:

- Each [select\\_expr](#) indicates a column that you want to retrieve. There must be at least one [select\\_expr](#).
- [table\\_references](#) indicates the table or tables from which to retrieve rows. Its syntax is described in [join](#).
- [SELECT](#) supports explicit partition selection using the [PARTITION](#) with a list of partitions or subpartitions (or both) following the name of the table in a [table\\_reference](#) (see [join](#)). In this case, rows are selected only from the
